Overview

Lightning strikes may cause permanent damage to household electrical equipment, including Lutron_® System components. Lightning strike-damaged equipment is not covered by the Lutron_® Warranty and should be reported to the homeowner's insurance company.

All Lutron® products are designed with integrated surge suppression devices. (Lutron follows the IEEE C62.41-1991 recommended practice on Surge Voltages in Low Voltage AC Power Circuits.) These integrated suppression devices are effective for preventing damage in most installations. Despite this fact, high-risk homes that are located in lightning-prone locations may experience surge levels that are capable of damaging Lutron® devices, particularly in the case of a direct lightning strike on the property. (For additional information on lightning-prone areas of the U.S. and abroad, see the maps at the end of this application note.) Although this type of damage is typically covered by the homeowner's insurance, there is inconvenience involved in getting equipment replaced and/or having non-functional products. Many installers and homeowners are interested in adding additional protection hardware to their systems to minimize the risk of this sort of disruption. This application note was written to address these interests.

The devices recommended in this document are some of the most rugged and cost-effective protection devices available. Although installing these devices will provide an added degree of protection, in the most extreme circumstances damage is still a possibility. The likelihood of damage occurring will be greatly reduced when surge protection is used. This application note covers surge protection of low voltage links and the high voltage side of the installation with use of AC panel mount surge suppression with filtering. This may require additional solutions including: lightning rods, grounding methods, and local (near to a component) surge suppression, etc. High voltage surge suppression requires expertise (consider consultants if this is not internal to your organization) and up-front planning/design.

Our customers often ask why Lutron doesn't integrate the surge protection provided by the external devices directly into our products. The primary reason is that over time (many surges) or given a surge with sufficient energy the suppression devices can/will fail. When they fail they tend to fail "shorted" to ground. This failure mode is "good" in the respect that it continues to protect the Lutron® equipment, although communications on the link will no longer work. External surge protection devices can be replaced easily, at low cost, with no reprogramming. If the devices were built into the Lutron® product, the entire product would have to be replaced. We may have delayed the product replacement but we haven't prevented it.

Other benefits of external protection are:

- For maximum protection, it is best to have surge energy shunted away before it gets into the Lutron® equipment
- The physical space required is impractical to implement in many products
- Not every customer needs to "pay" (in terms of size or cost) for this protection (for example, per the lightning strike maps, someone in the Northwest with a single building install, no integration connected,...)

Recommendations

Installation Based Recommendations

- Protect all electrical breaker panels feeding dimmers, processors, and dimming panels. A panel
 mounted surge suppression unit with enhanced filtering will protect equipment from catastrophic
 events, clean the power, and suppress internally generated transients that can lockup electronics,
 necessitate reprogramming of controls, and gradually deteriorate sensitive electronics. See Section
 3.4.3. IEEE Std.1100-2005.
- Protect all RS-232 ports with permanently connected third party equipment (typically other
 processors that are part of integration systems). While RS-232 communication wire runs are
 themselves short, all of the equipment and wire runs that are connected to the third-party
 equipment provide an electrical path to conduct damaging surges. Damage most often occurs
 because the ground referencing between the two systems can become separated during a surge.
 This creates high voltages that damage the RS-232 ports, and is the most common type of port
 failure.
- Protect any link or bus that travels between buildings regardless of geographical location.
 Again damage may occur because the ground referencing between buildings can become separated during a lightning strike. Lutron recommends using fiber optic communication between buildings. Using fiber cable breaks the electrical connection (by using light rather than current carrying conductors) and will minimize damage if one building gets struck. Refer to "RS-485 Communication Using Fiber Optics Modem FAQ" on the HomeWorks® Resource Website.
- Protect Links/Busses that have wire runs over 500 ft (152.4 m) long even if they are contained within a single building. A long wire run is susceptible to high levels of capacitively coupled surge energy as it travels alongside other wires and through the structure and mechanicals of the building.

Geographical Based Recommendations

Refer to the lightning strike maps at the end of this document.

- Protect all breaker panels feeding lighting system from internal and external surges.
- Protect 120 V~ outputs from dimming modules which go outside (such as to landscape lighting)
 in areas that are determined to be at high risk, such as those at high elevations, and those in close
 proximity to water.
- Protect **all** links/busses for installations in **orange** and **red** areas. In the US, for example, this would include Florida, the Southeast, and portions of the Midwest.
- Protect **all** links/busses for installations in areas that are determined to be at high risk, such as those at high elevations, and those in close proximity to water.

Note: The lightning strike maps in this application note are best viewed in color. Please view on a computer or print out in color.

Surge Protection Equipment

The following surge protection equipment may be used to protect lighting panels and all dimming controls. The following suppression units will protect the electrical system from external transients entering the system through the power lines. The filtering part of the units will clean the power, and suppress internally generated transients that can lockup electronics, necessitate reprogramming of controls, and gradually deteriorate sensitive electronics. See Section 3.4.3, IEEE Std.1100-2005.

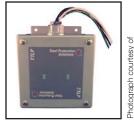

Breaker Panel Protection

1. Total Protection Solutions Breaker **Panel Protection**

Manufacturer: Total Protection Solutions, LLC.

Model Number: TK-TTLP-1S240-FL

Website: www.TPSsurge.com

RS-232 Surge Protection

The following surge protection equipment may be used to protect RS-232 ports

1. Total Protection Solutions RS-232 **Surge Protection**

Manufacturer: Total Protection Solutions, LLC

Model Number: TK-CT2-DB9-DIN2 Website: www.TPSsurge.com

Surge Protection Equipment (continued)

RS-485 Protection

The surge protection equipment listed below may be used to protect the RS-485 links.

1. Total Protection Solutions RS-485 **Surge Protection**

Manufacturer: Total Protection Solutions, LLC.

Model Number: TK-CT2-24LIT24 Model Number: TK-CT2-24LIT12 Model Number: TK-CT2-24LIT4 Website: www.TPSsurge.com

TK-CT2-24LIT24 (12 pair) TK-CT2-24LIT12 (6 pair) TK-CT2-24LIT4 (2 pair)

Note: 24-Terminal (12-pair), 12-terminal (6-pair), and 4-terminal (2-pair) devices are available. Choose model based on the number of RS-485 links and H48/D48 dimming busses to be protected. Same unit can be used for both dimming busses and links.

H48/D48 dimming interface Protection (HomeWorks® and HomeWorks® QS only)

The surge protection equipment listed below may be used to protect the H48/D48 dimming interface.

1. Total Protection Solutions H48/D48 Surge Protection

Manufacturer: Total Protection Solutions, LLC.

Model Number: TK-CT2-24LIT24 Model Number: TK-CT2-24LIT12

TK-CT2-24LIT24 (12 pair) TK-CT2-24LIT12 (6 pair)

Website: www.TPSsurge.com

Note: 24-Terminal (12-pair) and 12-terminal (6-pair) devices are available. Choose model based on the number of RS-485 links and H48/D48 dimming busses to be protected. Same unit can be used for both dimming busses and links.

Line Voltage Protection

Breaker Panel Equipment Placement - Using Total Protection Solutions

Example: Connection to breaker panel.

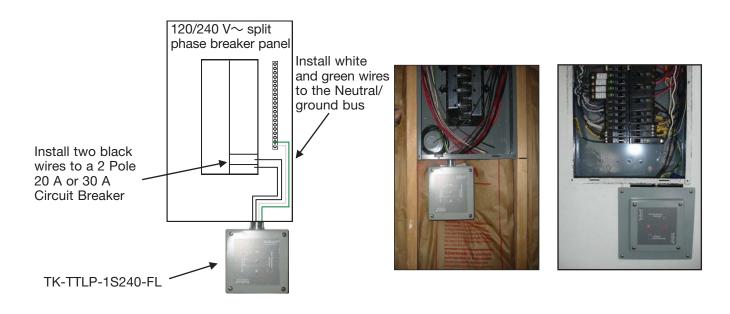

Locate and install one TK-TTLP-1S240-FL at each breaker panel feeding Homeworks® processors, dimming modules and remote module interface.

Breaker Panel Wiring Detail – Using Total Protection Solutions

Installation Based Recommendations

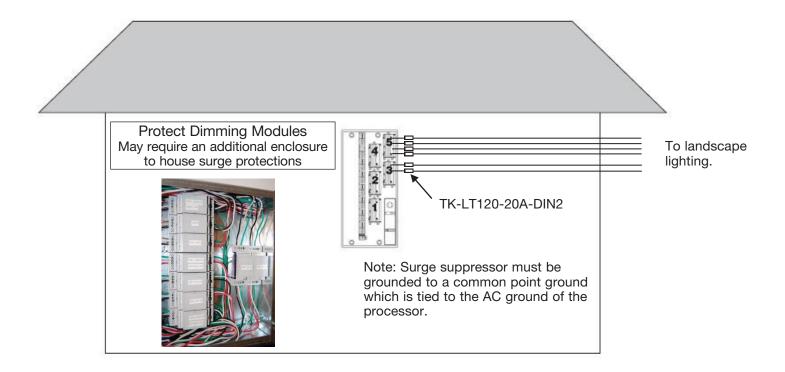

Install on all breaker panels powering Lutron® equipment.

Line Voltage Protection (continued)

Dimming Module Equipment Placement - Using Total Protection Solutions

Example: Connection to 120 V∼ landscape lighting

Dimming Module Wiring Detail – Using Total Protection Solutions

Total Protection Solutions Installation Based Recommendations

TK-LT120-20A-DIN2

From Dimming Modules

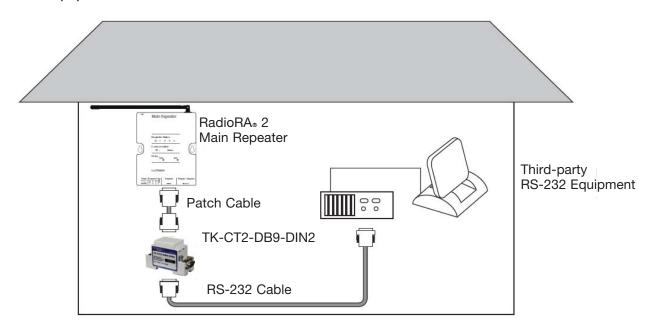

To Landscape Lighting

RadioRA® 2

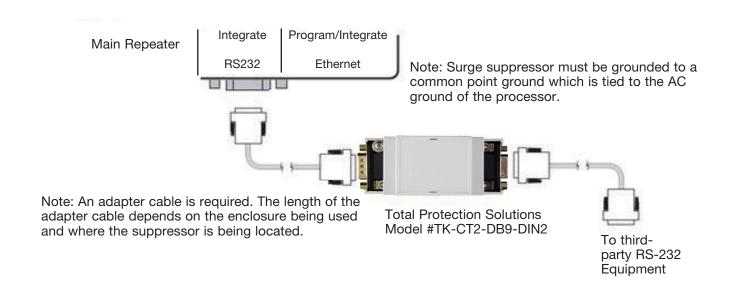

RS-232 Equipment Placement – Using Total Protection Solutions

Example: Total Protection Solutions Model # TK-CT2-DB9-DIN2 Connection to Third Party RS-232 Equipment

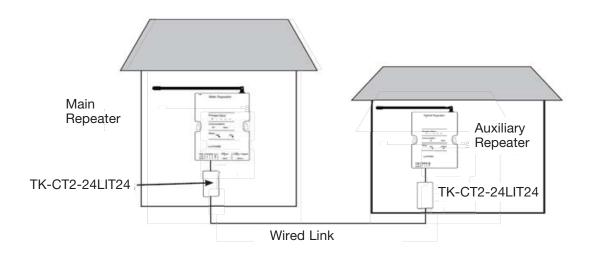

RS-232 Component Wiring Detail – Using Total Protection Solutions

Total Protection Solutions Model # TK-CT2-DB9-DIN2 with third-party RS-232 equipment

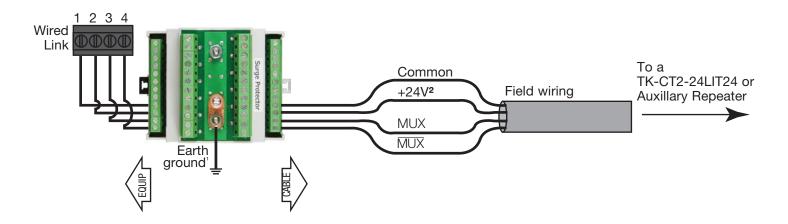

RadioRA® 2 (continued)

RS-485 Equipment Placement – Using Total Protection Solutions

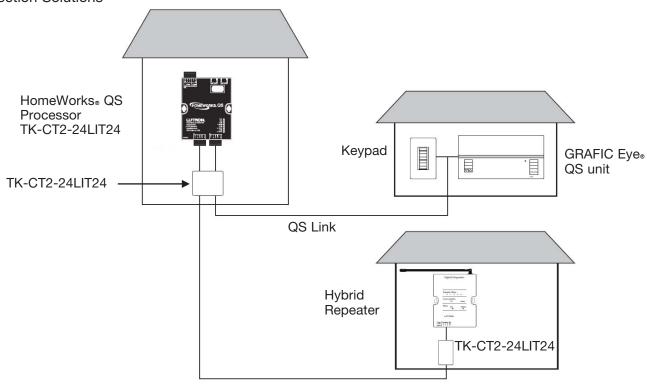

RS-485 Component Wiring Detail – Using Total Protection Solutions

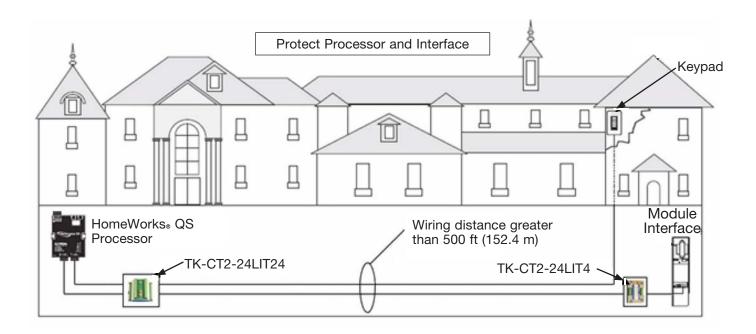

RS-485 Equipment Placement – Using Total Protection Solutions

Example: HomeWorks systems with low-voltage wire runs outside or between buildings using Total Protection Solutions

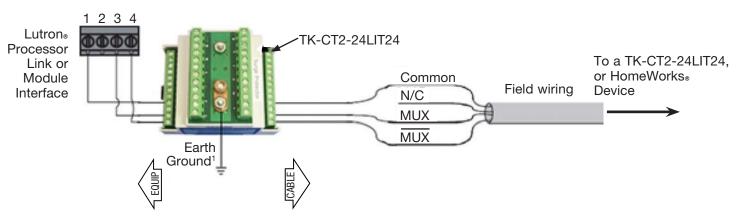

Example: System components that are wired greater than 500 ft (152.4 m) from the processor:

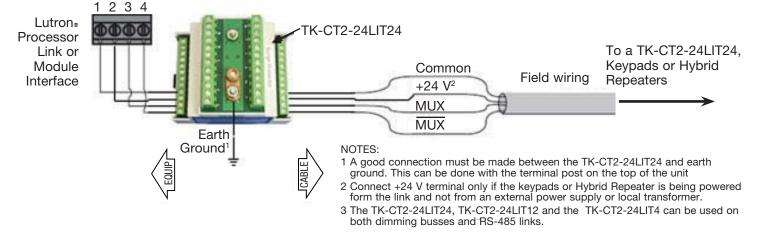

RS-485 Component Wiring Detail - Using Total Protection Solutions

Total Protection Solutions TK-CT2-24LIT24 with Inter-Processor Link, Module Interface Link, GRAFIK Eye
Link, Shade Interface or Dimmer Interface not powered by Processor

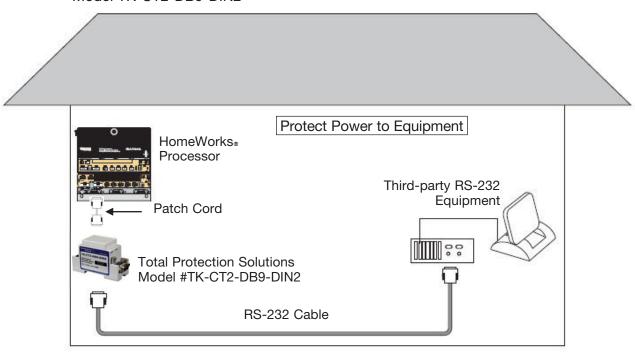

Total Protection Solutions TK-CT2-24LIT24 with Keypad Link, Hybrid Repeater Link

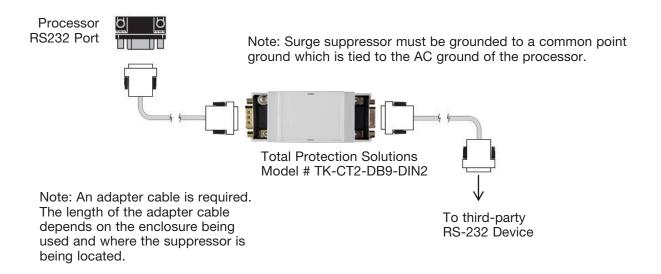

RS-232 Equipment Placement – Using Total Protection Solutions

Example: Connection to third-party RS-232 equipment using Total Protection Solutions Model TK-CT2-DB9-DIN2

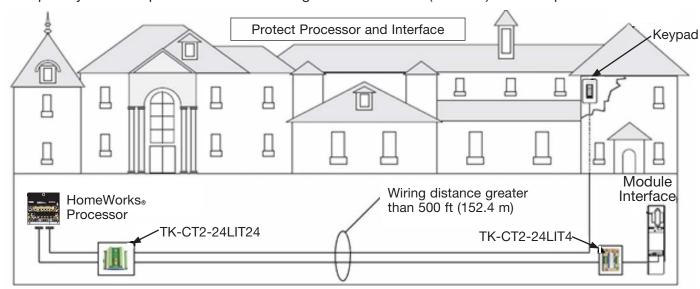

RS-232 Component Wiring Detail – Using Total Protection Solutions

Total Protection Solutions Model TK-CT2-DB9-DIN2 with third-party RS-232 equipment

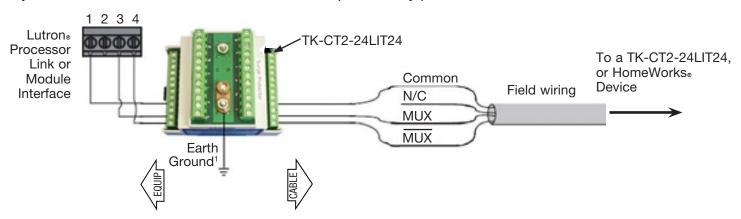

RS-485 Equipment Placement – Using Total Protection Solutions

Example: System components that are wired greater than 500 ft (152.4 m) from the processor:

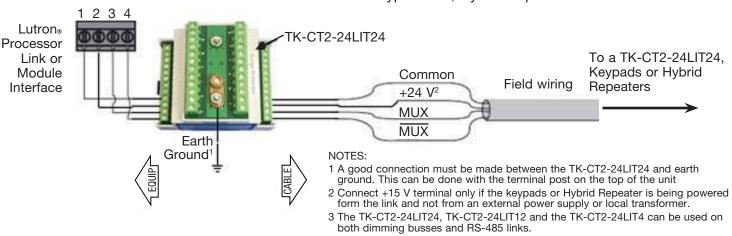

RS-485 Component Wiring Detail – Using Total Protection Solutions

Total Protection Solutions Model TK-CT2-24LIT24 with Inter-Processor Link, Module Interface Link, GRAFIK Eye_® Link, Shade Interface, Dimmer Interface not powered by processor

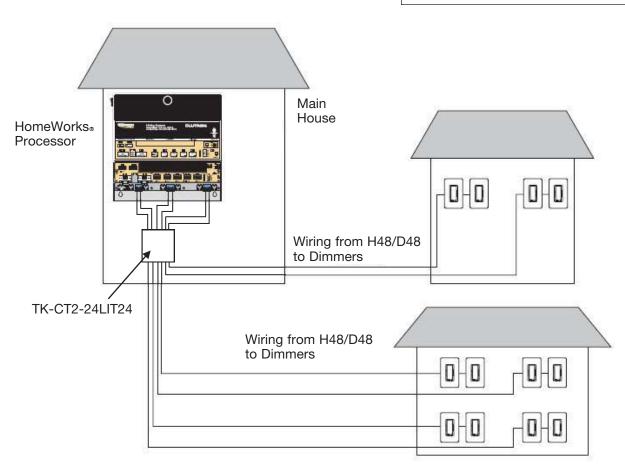

Total Protection Solutions Model TK-CT2-24LIT24 with Keypad Link, Hybrid Repeater Link

H48/D48 Equipment Placement - Using Total Protection Solutions

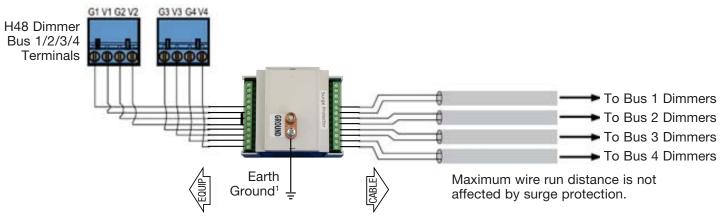

Example: HomeWorks systems with low-voltage wire runs outside or between buildings using Total Protection Solutions

Protect H48/D48 Dimmer Interface

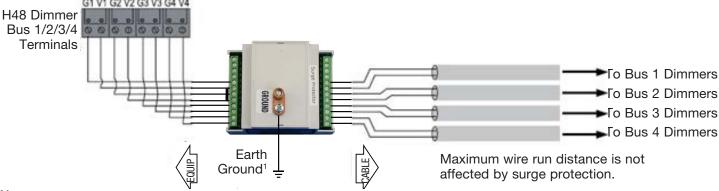

H48/D48 Component Wiring Detail - Using Total Protection Solutions

Total Protection Solutions Model TK-CT2-24LIT12 with H48 Dimmer Busses

Total Protection Solutions Model TK-CT2-24LIT12 with Keypad Link, Hybrid Repeater Link

Notes:

- ¹ A good connection must be made between the TK-CT2-24LIT12 and earth ground. This can be done with the terminal post on the top of the unit.
- ² To protect an entire H48 Interface use (1) TK-CT2-24LIT12 or use (1) TK-CT2-24LIT24 for both dimming busses and RS-485 links.
- ³ To protect an entire D48 Interface use (1) TK-CT2-24LIT24 or use (2) TK-CT2-24LIT12.
- ⁴ The TK-CT2-24LIT24, TK-CT2-24LIT12 and the TK-CT2-24LIT4 can be used on both dimming busses and RS-485 links.

Combination RS-485 and H48/D48 Component Wiring Detail

Total Protection Solutions Model TK-CT2-24LIT24 with Inter-Processor Link, Module Interface Link, GRAFIK Eye_® Link, Shade Interface, Dimmer Interface, Keypad Link & Hybrid Repeater Link

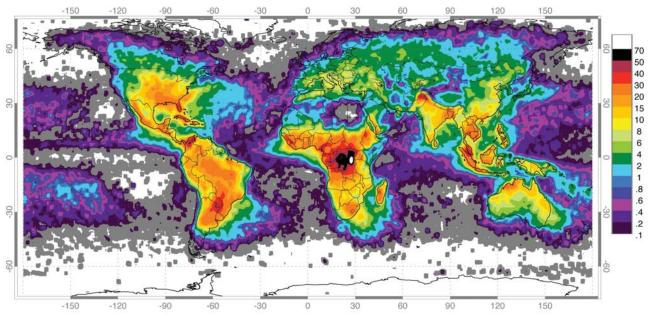

Note: The TK-CT2-24LIT24, TK-CT2-24LIT12 and the TK-CT2-24LIT4 can be used on both dimming busses and RS-485 links.
